PENDING CLAIMS (No Changes Made)

1. (Original) A blade member for an airplane, which constitutes at least a portion of a

rotor blade of the airplane, said blade member comprising:

an outer skin area surrounded by a first outer skin, a second outer skin, a leading edge

and a trailing edge each having a predetermined wall thickness; and

at least one reinforcing area extending in a span direction within the outer skin area

and connected to the first outer skin and the second outer skin;

wherein said outer skin area and said reinforcing area are integrally formed by wire

electrical discharge-machining.

2. (Original) The blade member for an airplane according to claim 1, wherein at least

one of wall thickness of said first outer skin and said second outer skin changes in a cord

direction.

3. (Original) The blade member for an airplane according to claim 1, wherein a

distance between outer surfaces of said first outer skin and said second outer skin is gradually

decreasing toward the trailing edge to become approximately zero at the trailing edge.

4. (Original) The blade member for an airplane according to claim 2, wherein a

distance between outer surfaces of said first outer skin and said second outer skin is gradually

decreasing toward the trailing edge to become approximately zero at the trailing edge.

5. (Original) The blade member for an airplane according to claim 2, wherein the wall

thickness of the first outer skin includes a central portion that is thicker relative to the leading

edge and trailing edge.

6. (Original) The blade member for an airplane according to claim 1, wherein two

reinforcing areas are provided within the outer skin area for connecting the first outer skin to

the second outer skin, said two reinforcing areas being spaced a predetermined distance

relative to each other.

7. (Original) The blade member for an airplane according to claim 1, wherein the

blade member is constructed of an aluminum alloy.

8. (Original) The blade member for an airplane according to claim 1, wherein the first

outer skin is curved upwardly.

9. (Original) The blade member for an airplane according to claim 1, wherein said

second outer skin is substantially flat.

10. (Original) The blade member for an airplane according to claim 1, wherein two

reinforcing areas are provided within the outer skin area for connecting the first outer skin to

the second outer skin, said two reinforcing areas being spaced a predetermined distance

relative to each other and said first outer skin being curved upwardly and includes a

thickened portion extending between the two reinforcing areas.

11. (Withdrawn) A method of forming a blade member for an airplane comprising the

following steps:

using wire electrical discharge-machining for forming an outer skin area surrounded

by a first outer skin, a second outer skin, a leading edge and a trailing edge each having a

predetermined wall thickness;

using wire electrical discharge-machining for forming at least one reinforcing area

extending in a span direction within the outer skin area and connected to the first outer skin

and the second outer skin; and

integrally forming said outer skin area and said reinforcing area by wire electrical

discharge-machining.

12. (Withdrawn) The method according to claim 11, and further including the step of

forming at least one wall thickness of said first outer skin and said second outer skin to

change in a cord direction.

13. (Withdrawn) The method according to claim 11, and further including the step of

forming a distance between outer surfaces of said first outer skin and said second outer skin

that is gradually decreasing toward the trailing edge to become approximately zero at the

trailing edge.

14. (Withdrawn) The method according to claim 12, and further including the step of

forming a distance between outer surfaces of said first outer skin and said second outer skin

is gradually decreasing toward the trailing edge to become approximately zero at the trailing

edge.

15. (Withdrawn) The method according to claim 12, and further including the step of

forming the wall thickness of the first outer skin to include a central portion that is thicker

relative to the leading edge and trailing edge.

16. (Withdrawn) The method according to claim 11, and further including the step of

forming two reinforcing areas within the outer skin area for connecting the first outer skin to

the second outer skin, said two reinforcing areas being spaced a predetermined distance

relative to each other.

17. (Withdrawn) The method according to claim 11, and further including the step of

forming the blade member of an aluminum alloy.

18. (Withdrawn) The method according to claim 11, and further including the step of

forming the first outer skin to be curved upwardly.

19. (Withdrawn) The method according to claim 11, and further including the step of

forming said second outer skin to be substantially flat.

20. (Withdrawn) The method according to claim 11, and further including the step of

forming two reinforcing areas within the outer skin area for connecting the first outer skin to

the second outer skin, said two reinforcing areas being spaced a predetermined distance

relative to each other and said first outer skin being curved upwardly and includes a

thickened portion extending between the two reinforcing areas.
